No. is the number of results predicted by chance to have score greater than or equal to the score of the result being part and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of hits satisfying chosen parameters:

Claim 6; Fig 1; 58pp; English.
This sequence represets human eph/elk-like kinase (HEK). HEK is expressed in both pre-B cells and T cell lines and in a number of tumours of human origin, eg. lymphoid tumours LK63, Lila-1 and JM, and the epithelial tumour HELA. This receptor-type thymidine kinase and the epithelial tumour HELA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein

Probes derived from the EPH-related PTKs Cek4 (Q90659) and Ce (Q90660) were used to isolate novel cDNA clones (Q90652-58, Q90661-62) from chicken embryo and embryonic brain libraries. Cek4 is highly expressed in the chicken developing brain and embryonic tissues and also in the adult brain and retina.

                                Claim 18; Page 54-57; 133pp; English.

4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7,

HEK8 and HEK11 (R85089-92), respectively, were identified following

1 isolation of their encoding cDNAs (702946-49) from a human foetal brain

1 cDNA library. HEK5, HEK7 and HEK8 show extensive homology to the

2 catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8.

2 HEK11 shows no homology to any known EPH-like receptor. Recombinant

3 HEK receptors (or their soluble extracellular domains) are produced by

3 expression of encoding sequences in procaryotic or eucaryotic host

3 cells, and are used to produce antibodies (utilised in diagnostic

4 assays), or to identify and purify ligands for HEK receptors, or

5 therapeutically to modulate the activation of cell-associated

5 receptors. Soluble HEK7 receptor may primarily affect

5 proliferation and/or differentiation of brain cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The nucleic acid sequence encoding Bsk can be used in Bsk nucleic acid probes, which can be used in detecting alterations is the level of Bsk messenger-RNA (mRNA) in biological samples isolated from a mammal afflicted with a disease, such as neurodegenerative diseases or disorders and neoplasms. The nucleic acid sequence can albe delivered into the limbic system of patients with limbic system neurodegenerative disease, disorder or injury, to promote or enhance limbic system neuron regeneration or growth. Such neurodegenerative diseases include, chromosomal abnormalities, degenerative growth and development disorders, viral infections, bacterial infections, brain injuries, neoplastic conditions, Alzheimer's disease, epilepsy, schizophrenia, or stroke and cerebral ischaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid sequence encoding protein - used in nucleic acid probes, used in detecting alterations in lever messenger-RNA in biological samples isolated from mammal a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kromer LF, Schulz NT, Woude GFV, WPI; 98-541751/46.

Example 1; Page 50-53; 75pp; English.

Rat REK7 (R97853) is an eph-related tyrosine kinase receptor, for which AL-1 (see also W97854) is a ligand. Its amino acid sequence was deduced from a cDNA clone (T18893) isolated from a hippocampal cDNA library. An REK 19G fusion was used to screen cultured cell lines for surface expression of REK7-binding activity. Primers (see also T44382-83) based on peptide sequences (R97856-59) of isolated ligands were used to amplify human breast carcinoma BT20 cell cDNA, and an amplified fragment was used to screen a human foetal brain cDNA library, leading to the isolation of AL-1 cDNA contacts.

Example; Fig 22; 194pp; English.

The present invention describes nucleic acid molecures are ror-2, ehk-1 and ehk-2. Also described are the corresponding prot Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence represents rat Ehk-1.
                                               domain and Ig constant domain, useful for studying, and therapeutic modulation of, cell growth and differentiation
Disclosure; Page 95-99; 125pp; English.
DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. The bpTKS, bpTK3, bpTK4, bpTK5 and bpTK7 (R85924-28 and R85935, respectively) are expressed in human brain tissue and show homology to known pTKs. A full-length sequence for bpTK7 (R85936) was also obtd. bpTK7 can be used to design drugs that modulate pTK activity.
                                                                                                                                                                                                                                     12-OCT-1995.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7 HEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (T02946-49) from a human foetal br cDNA library. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced expression of encoding sequences in procaryotic or eucaryotic host cells, and are used to produce antibodies (utilised in diagnostic assays), or to identify and purify ligands for HEK receptors, or therepoutlically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   or prodn.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. Also described are the corresponding prot Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence represents rat Ehk-2. Sequence 948 AA;

                                                                                                                  8
                                                                                                                                                                                                                     PT DNA encoding embryonic stem cell kinase, receptor tyrosine kinase - production of modulators and antibodies, useful to treat mucositis and other disorders involving epithelium Claim ; page 48-54; 98pp; English.

Novel mouse embryonic stem cell kinase (Esk) is a receptor tyrosine kinase that belongs to the Eph subfamily. Its amino acid sequence was deduced from a DNA molecule (T72320) isolated from a murine liver cDNA library. Recombinant Esk polypeptides, esp. soluble Esk (extracellular domain), can be produced in host cells and used for ligand isolation, as antagonists of Esk-ligand interaction and as immunogens for prodn. of antibodies useful as diagnostic reagents or therapeutic antagonists of Modulation of Esk expression can be used to treat mucositis (partic. when caused by cancer treatment), and as Esk is expressed in all epithelial tissues its modulation may be used to treat e.g. skin injuries, hair loss, corneal or peptic ulcers, ulcerative colitis, oesophageal reflex, sjorgren's syndrome and related autoimmune disease, mucosal infections and pancreatitis.
                                                                                                                                               Matches

HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced expression of encoding sequences in procaryotic or eucaryotic host cells, and are used to produce antibodies (utilised in diagnostic assays), or to identify and purify ligands for HEK receptors, or therapeutically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                   Mouse developmental kinase 1 MDK1 T1.

CDNA cloning using adult mouse brains and Northern blotting clonary clonary controls, MDK1 T1 (W03422) and MDK1 T2 (W03423), of the novel mouse developmental kinase 1 (MDK1) (see also C (W03421), a new member of the eck/eph family of receptor tyrosine c kinases. Their amino acid sequences were deduced from cDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential signal transduction.

CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDKI T1 (W03422) and MDKI T2 (W03423), of the novel mouse developmental kinase 1 (MDKI) (see also W03421), a new member of the eck/eph family of receptor tyrosine kinases. Their amino acid sequences were deduced from cDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New mouse diagnosis

12 Mouse developmental kinase 1 (MDK1) (W03421) is a new member of the ceck/eph family of receptor tyrosine kinases (RTKs). Its amino cack/eph family of receptor tyrosine kinases (RTKs). Its amino acid sequence was deduced from a cDNA clone (T32960) isolated from mouse embryo and adult brain libraries. The distinct patterns of MDK1 expression during mouse development suggest an important role for MDK1 in the formation of neuronal structures. MDK1 may be obtd. by expression in host cells. It can be used in methods for the diagnosis of diseases characterised by abnormality in a signal transduction pathway, such as neuroproliferative or neurodegenerative disorders or cancer, to screen for (ant)agonists, and to raise antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

PT Imman and yeast alanyl-tRNA synthetase genes - useful for production of recombinant enzymes for diagnostic and analytical applications PS Claim 3; Column 43-48; 42pp; English.

CC W19968 shows the amino acid sequence of human alanyl-tRNA synthetase CC (Ala-tRS). Human Ala-tRS and antibodies specific for it, may be useful CC in assays for diagnosing and monitoring an autoimmune disease known as CC antisynthetase syndrome. A condition in which patients having CC polymyositis and/or dermatomyositis produce antibodies against the cessential synthetase enzyme. Anti-synthetase syndrome is characterised by a number of clinical presentations, including interstitial lung CC disease, arthritis, Raynaud's phenomenon and fever. Human Ala-tRS can be used to assess the toxic effects of antimicrobial Ala-tRS can CC of such antimicrobial agent which complements or substitutes the CC function of the native gene can be used to test for any toxic effects of such antimicrobial agents that specifically interacts with the human CC Ala-tRS gene or protein. Ala-tRS proteins can be used to separate CC alanine from other amino acids, to separate L-alanine from D-alanine, CC quantitative determination of alanine or ATP.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

ONE OF THE IN-VIVO FUNCTION OF THIS ENZYME IS THE ADDITION OF NUCLEOTIDES AT THE JUNCTION OF THIS ENZYME IS THE ADDITION OF RUCLEOTIDES AT THE JUNCTION (N REGION) OF REARRANGED IG HEAVY CHAIN AND T CELLS.

-I- CATALYTIC ACTIVITY: N DEOXYNUCLEOSIDE TRIPHOSPHATE + (DEOXY NUCLEOTIDE)(M) = N PYROPHOSPHATE + (DEOXYNUCLEOTIDE)(M+N).

-I- COFACTOR: REQUIRES MAGNESIUM.
-I- SUBCELLULAR LOCATION: NUCLEAR (TDT-S) OR CYTOPLASMIC (TDT-L).

-I- ALTERNATIVE PRODUCTS: TWO ISOFORMS; TDT-L/ARRED, AND TOT-S(MALL); ARE PRODUCED BY ALTERNATIVE SPLICING. THE TDT-S FORM IS THE MAJOR FORM. THE TWO FORMS DIFFER IN SUBCELLULAR LOCATION AND IN ACTIVITY AS THE LONG CYTOPLASMIC FORM CAN NOT ACT ON NECESTAL.
